## 2. Description

|                    |                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | This data set is a shapefile of the Greenland Ice Sheet boundary generated as a part of the inventory of the local glaciers and ice caps. It includes the local glaciers with a CL2 connectivity (see Rastner et al. 2012). |
| <b>Methods</b>     | Band ratio 3/5 with manual correction of debris cover, seasonal snow, shadow, water (outside of glaciers), sea ice and icebergs.                                                                                            |
| <b>References</b>  | Rastner, P., Bolch, T., Mölg, N., Machguth, H., Le Bris, R., Paul, F. (2012): The first complete inventory of the local glaciers and ice caps on Greenland. The Cryosphere 6, 1483–1495. (doi:10.5194/tc-6-1483-2012)       |
| <b>Citation</b>    | When using this dataset, please cite the above reference (Rastner et al. 2012).                                                                                                                                             |

Decoding of the numbers shown for the scene footprints. The image ID first describes the sensor (LE7=Landsat 7 ETM+, LT5: Landsat 5 TM), followed by path (ppp) and row (rrr), the year (yyyy) and the day in the year (ddd). the last five digits relate to the receiving station.
